apk Alpine package manager

CONCEPTS

apk keeps a world file (/etc/apk/world) of what you asked for; everything else is a dependency and goes away with it.

Repositories /etc/apk/repositories
↓ `apk update`
Local index package list
↓ `apk add`
World file wanted packages
↓ `resolve`
Installed world + deps

INSTALL AND REMOVE

`apk add` *`<pkg>`*
Install a package

`apk add` *`<pkg1> <pkg2>`*
Install several packages

`apk add --no-cache` *`<pkg>`*
Install, skip the local index cache

`apk del` *`<pkg>`*
Remove a package and unused deps

`apk del -r` *`<pkg>`*
Also remove packages depending on it

`apk add -t` *`<name> <pkg>...`*
Group packages as a virtual package

`apk del` *`<name>`*
Remove a virtual package and its deps

`apk add` *`<pkg>`*`=`*`<version>`*
Install a specific version

`apk add` *`<pkg>`*`@`*`<tag>`*
Install from a tagged repository

`apk add -u` *`<pkg>`*
Upgrade a package if installed

`apk add cmd:`*`<command>`*
Install whichever package provides a command

`apk add -s` *`<pkg>`*
Simulate an install

UPDATE AND UPGRADE

`apk update`
Refresh the package index

UPDATE AND UPGRADE (cont.)

`apk upgrade`
Upgrade all installed packages

`apk update && apk upgrade`
Refresh, then upgrade

`apk upgrade -s`
Preview an upgrade

`apk upgrade --available`
Sync to repos after a release switch

`apk upgrade` *`<pkg>`*
Upgrade only this package

`apk list -u`
List upgradable packages

`apk fix`
Repair or reinstall broken packages

SEARCH AND INSPECT

`apk search` *`<name>`*
Search package names

`apk search -e` *`<name>`*
Search for an exact name

`apk search -d` *`<text>`*
Search descriptions

`apk search -v` *`<name>`*
Show versions and descriptions

`apk search cmd:`*`<command>`*
Find the package providing a command

`apk info` *`<pkg>`*
Show package details

`apk info`
List installed packages

`apk list -I`
List installed packages with versions

`apk info -L` *`<pkg>`*
List files in a package

`apk info -W` *`<path>`*
Find the package owning a file

`apk info -e` *`<pkg>`*
Check whether a package is installed

`apk info -R` *`<pkg>`*
List a package's dependencies

SEARCH AND INSPECT (cont.)

`apk info -r` *`<pkg>`*
List packages depending on it

`apk policy` *`<pkg>`*
Show available versions and repos

REPOSITORIES

`cat /etc/apk/repositories`
Show configured repositories

`apk add -X` *`<url>`* *`<pkg>`*
Add a repository for one command

Repositories are main, community and testing; testing is edge-only. Use a @tag prefix to opt in per package.

repositories line

Part	Example
`Plain`	https://dl-cdn.alpinelinux.org/alpine/v3.20/main
`Community`	https://dl-cdn.alpinelinux.org/alpine/v3.20/community
`Edge testing`	@testing https://dl-cdn.alpinelinux.org/alpine/edge/testing
`Local path`	/var/apk/my-packages

CACHE AND WORLD

`apk cache clean`
Delete outdated cached packages

`apk fetch` *`<pkg>`*
Download a package without installing

`cat /etc/apk/world`
Show explicitly installed packages

`update-conf`
Merge .apk-new config files

RECIPES

Dockerfile install

```
FROM alpine:3.20
RUN apk add --no-cache curl ca-certificates
```

Temporary build dependencies

```
apk add --no-cache -t .build-deps build-base
# compile something here
apk del .build-deps
```
