AWS CLI Amazon cloud CLI

CONCEPTS

Shape: aws <service> <operation> [--options]. Add help at any level. Always check sts get-caller-identity before changing anything.

SETUP AND PROFILES

`aws configure`
Prompt for keys, region and output

`aws configure --profile <name>`
Create or edit a named profile

`aws configure sso`
Set up an IAM Identity Center profile

`aws sso login --profile <name>`
Sign in through the browser

`aws configure list`
Show where each setting comes from

`export AWS_PROFILE=<name>`
Use a profile for the whole shell

`aws sts get-caller-identity`
Show the account and identity in use

GLOBAL OPTIONS

`--profile <name>`
Use this profile for one command

`--region <region>`
Override the region

`--output json|table|text|yaml`
Choose the output format

`--query '<jmespath>'`
Filter and reshape the result

S3 TRANSFERS

`aws s3 ls`
List buckets

`aws s3 ls s3://<bucket>/<prefix>/`
List objects under a prefix

`aws s3 cp <file> s3://<bucket>/<key>`
Upload a file

S3 TRANSFERS (cont.)

`aws s3 cp s3://<bucket>/<key> <file>`
Download an object

`aws s3 cp <dir> s3://<bucket>/ --recursive`
Upload a folder

`aws s3 sync <dir> s3://<bucket>/<prefix>`
Make the target match the source

`aws s3 rm s3://<bucket>/<key>`
Delete one object

`aws s3 mb s3://<bucket>`
Create a bucket

`--exclude '<glob>' --include '<glob>'`
Filter transfers (later flags win)

`--dryrun`
Preview s3 cp, sync, mv or rm

`aws s3 presign s3://<bucket>/<key> --expires-in <sec>`
Make a temporary download URL

EC2

`aws ec2 describe-instances`
List instances

`aws ec2 describe-instances --instance-ids <id>`
Show one instance

`aws ec2 stop-instances --instance-ids <id>`
Stop an instance

OUTPUT AND QUERIES

`--query 'Reservations[].Instances[].InstanceId'`
Flatten to a list of values

HELP AND DISCOVERY

`aws <service> help`
List a service's operations
