AWS SAM CLI Serverless on AWS

CONCEPTS

A SAM template is CloudFormation with shorthand resources (AWS::Serverless::Function). sam build prepares code, sam deploy hands the template to CloudFormation.

template.yaml SAM template
↓ sam build
.aws-sam/build built artifacts
↓ sam deploy
CloudFormation change set
↓ creates
Lambda, API, ... per stack

Local commands (local invoke, start-api) need Docker running. Run sam build first so they use the built code.

sam deploy --guided writes samconfig.toml; later runs of sam deploy need no flags.

PROJECT

`sam init`
Create a project interactively

`sam init --runtime <runtime> --name <name> --app-template <template> --no-interactive`
Create a project without prompts

`sam validate`
Check the template is valid

`sam validate --lint`
Also lint with cfn-lint

`sam list resources --stack-name <name>`
Show resources and physical IDs

`sam list endpoints --stack-name <name>`
Show API and function endpoints

BUILD

`sam build`
Build all functions and layers

`sam build <FunctionId>`
Build a single resource

`sam build --use-container`
Build in a Lambda-like container

`sam build --cached --parallel`
Reuse unchanged builds, build in parallel

LOCAL TESTING

`sam local invoke`
Run the only function once

`sam local invoke <FunctionId> --event <file>`
Run a function with an event file

`sam local invoke --env-vars <file>`
Set environment variables from JSON or .env

`sam local start-api`
Serve the API on localhost:3000

`sam local start-api --warm-containers EAGER`
Keep containers between requests

`sam local generate-event <service> <event>`
Print a sample event

DEPLOY

`sam deploy --guided`
Answer prompts, save samconfig.toml

`sam deploy`
Deploy using saved config

`sam deploy --stack-name <name> --resolve-s3 --capabilities CAPABILITY_IAM`
Deploy with no prompts

`sam deploy --no-confirm-changeset`
Skip the changeset prompt

`sam deploy --parameter-overrides ParameterKey=<k>, ParameterValue=<v>`
Set a template parameter

`sam deploy --config-env <env>`
Use a named samconfig.toml section

`sam deploy --no-fail-on-empty-changeset`
Exit 0 when nothing changed

`sam deploy --profile <profile> --region <region>`
Pick credentials and region

SYNC & REMOTE

`sam sync --stack-name <name> --watch`
Auto-sync code and infra changes

SYNC & REMOTE (cont.)

`sam sync --stack-name <name> --code`
Push code changes once, skip CloudFormation

`sam sync --stack-name <name> --code --resource-id <FunctionId>`
Sync a single resource

`sam remote invoke <FunctionId> --stack-name <name>`
Invoke the deployed function

`sam remote invoke <FunctionId> --stack-name <name> --event '<json>'`
Send an inline event

LOGS & TRACES

`sam logs --stack-name <name>`
Fetch recent logs for the stack

`sam logs --stack-name <name> --tail`
Follow logs live

`sam logs -n <FunctionId> --stack-name <name>`
Logs for one function

`sam logs --stack-name <name> --filter "<pattern>"`
Only matching log events

CONFIG & CLEANUP

`sam delete`
Delete the stack (prompts)

`sam delete --stack-name <name> --no-prompts`
Delete without asking

`sam <command> --debug`
Debug logging with timestamps

`sam <command> --help`
Show a command's options

RECIPES

First deploy

```
sam init
cd <name>
sam build
sam deploy --guided
```

Test a function locally

```
sam local generate-event s3 put > event.json
sam build
sam local invoke <FunctionId> -e event.json
```
