Cabal Haskell build tool

CONCEPTS

Commands work on a project: a cabal.project (or just one .cabal file) and the packages it lists. Builds land in dist-newstyle.

PROJECTS

cabal init --interactive
Create a package with prompts

BUILD

cabal build
Build all default targets

cabal build *<target>*
Build one package or component

cabal build all
Build every package in the project

cabal build -w ghc-*<version>*
Use a specific compiler

RUN & REPL

cabal run
Run the only executable

cabal run *<exe>* **--** *<args>*
Run an executable with arguments

cabal repl
Open GHCi on the default target

TEST & DOCS

cabal test
Build and run all test suites

DEPENDENCIES

cabal update
Download the latest package index

cabal freeze
Write cabal.project.freeze

INSTALL

cabal install *<exe>*
Install an executable from Hackage

PACKAGE FILE

.cabal stanzas

Stanza	Use
`library`	Reusable code; list exposed-modules
`executable <name>`	Program; needs main-is
`test-suite <name>`	Tests; type: exitcode-stdio-1.0
`benchmark <name>`	Benchmarks; same form as tests
`common <name>`	Shared fields, pulled in with import:

Common fields

Field	Meaning
`cabal-version`	Spec version, e.g. 3.0
`build-depends`	Packages with version bounds
`hs-source-dirs`	Where the .hs files live
`default-language`	GHC2021 or Haskell2010
`ghc-options`	Flags such as -Wall
`other-modules`	Internal, not exported modules

.cabal skeleton

```
cabal-version: 3.0
name:          demo
version:       0.1.0.0
build-type:    Simple

common shared
    default-language: GHC2021
    ghc-options:      -Wall
    build-depends:    base <5

library
    import:           shared
    hs-source-dirs:   src
    exposed-modules:  Demo

executable demo
    import:           shared
    hs-source-dirs:   app
    main-is:          Main.hs
    build-depends:    demo
```

CABAL.PROJECT

packages: .
List the packages in the project
