Firebase CLI Deploy Firebase apps

CONCEPTS

firebase.json says what to deploy; .firebaserc says which project (and aliases) to deploy to.

firebase init firebase.json
↓ `emulators:start`
Emulators local test
↓ `deploy`
Project live services

ACCOUNT & PROJECTS

`firebase login`
Sign in via browser

`firebase projects:list`
List your projects

`firebase use <project>`
Set the active project

`firebase use --add`
Add a project alias

`firebase use <alias>`
Switch to an alias

`firebase --project <id> <command>`
Override project for one run

SETUP

`npm install -g firebase-tools`
Install the CLI

`firebase init`
Configure services here

`firebase init hosting`
Set up one service

DEPLOY

`firebase deploy`
Deploy all configured services

`firebase deploy --only hosting`
Deploy Hosting only

`firebase deploy --only functions`
Deploy all functions

DEPLOY (cont.)

`firebase deploy --only functions:<name>`
Deploy one function

`firebase deploy --only firestore:rules`
Deploy Firestore rules

`firebase deploy --only firestore:indexes`
Deploy Firestore indexes

HOSTING

`firebase hosting:channel:deploy <channel>`
Deploy to a preview channel

`firebase serve --only hosting`
Serve Hosting locally

FUNCTIONS

`firebase functions:log`
Show function logs

`firebase functions:log --only <name>`
Logs of one function

`firebase functions:list`
List deployed functions

`firebase functions:delete <name>`
Delete a function

EMULATORS & FIRESTORE

`firebase emulators:start`
Start all emulators

`firebase emulators:start --only <list>`
Start chosen emulators

`firebase emulators:start --import <dir>`
Load saved emulator data

`firebase emulators:exec "<cmd>"`
Run tests against emulators
