mypy Python type checker

CONCEPTS

mypy only checks annotated functions by default; add --check-untyped-defs to look inside the rest.

Your code annotations
↓ mypy
Type checker no code runs
↓ reads
Stubs and py.typed library types
↓ reports
Errors file:line [code]

RUNNING

`mypy <file.py> <dir>`
Check files and directories

`mypy .`
Check everything under here

`mypy -p <package>`
Check a package recursively

`mypy -m <module>`
Check one module by name

`mypy --exclude '<regex>' .`
Skip matching paths

STRICTNESS

`mypy --strict .`
Enable the strict flag bundle

`mypy --check-untyped-defs .`
Check bodies of untyped functions

`mypy --disallow-untyped-defs .`
Require annotations on functions

`mypy --disallow-incomplete-defs .`
Forbid half-annotated functions

`mypy --disallow-any-generics .`
Require type args on list, dict

`mypy --warn-return-any .`
Warn when returning Any

`mypy --warn-unused-ignores .`
Flag useless type: ignore

IMPORTS AND STUBS

`mypy --ignore-missing-imports .`
Silence unresolved imports

`mypy --install-types`
Install suggested stub packages

`pip install types-<name>`
Add typeshed stubs for a library

OUTPUT

`mypy --pretty .`
Show source snippets and carets

CONFIG

`mypy --config-file <path> .`
Use a specific config file

Where config is found (first match wins)

File	Section
`mypy.ini`	[mypy]
`.mypy.ini`	[mypy]
`pyproject.toml`	[tool.mypy]
`setup.cfg`	[mypy]

A per-module section looks like [mypy-pkg.*] in INI or [[tool.mypy.overrides]] with module = "pkg.*" in pyproject.toml.

IGNORING AND ANNOTATING

`x = f()  # type: ignore`
Suppress errors on this line

`x = f()  # type: ignore[<code>]`
Suppress only one error code

`reveal_type(<expr>)`
Print the inferred type

`def f(x: int | None) -> str:`
Annotate args and return

DAEMON AND CACHE

`dmypy run -- <args>`
Check, starting the daemon if needed
