Nushell Structured data shell

CONCEPTS

Pipelines pass typed data (tables, records, lists), not text, so filter by column instead of parsing with grep and awk.

Source ls, open, ps
↓ |
Table rows + columns
↓ where / select
Filtered still structured
↓ to json / save
Output text or file

Nushell is not POSIX: no $VAR, no &&, no backtick substitution. External commands still run and return text.

NAVIGATE & FILES

ls
List files as a table

ls **/*.rs
Glob recursively

cd *<dir>*
Change directory

mkdir *<dir>*
Create directory with parents

OPEN & CONVERT

open *<file>*
Load file, parsed by extension

open --raw *<file>*
Read as plain text

save *<file>*
Write pipeline to file

from json / from yaml / from csv
Parse text into data

to json / to yaml / to csv
Render data as text

http get *<url>*
Fetch URL, parse JSON

FILTER & SHAPE

where *<col>* == *<val>*
Keep matching rows

select *<col>* *<col>*
Keep columns

reject *<col>*
Drop columns

get *<col>*
Pull out column or field

get a.b.0
Cell path into nested data

sort-by *<col>*
Sort rows

sort-by -r *<col>*
Sort descending

first *<n>* **/ last** *<n>*
Take rows from either end

each {|x| ... }
Map over items

update *<col>* **{|r| ... }**
Change a column

insert *<col>* **{|r| ... }**
Add a new column

STRINGS & TEXT

$"hello ($name)"
Interpolate expressions

str replace *<a>* *<b>*
Replace text

VARIABLES & FLOW

let *<name>* **=** *<value>*
Immutable variable

COMMANDS & MODULES

def *<name>* **[x: int] { }**
Custom command

help *<command>*
Help for one command
