Racket Language and raco tools

CONCEPTS

A file starts with #lang racket (or racket/base, typed/racket, ...). Running racket <file> requires that module and runs its main submodule if present.

Write #lang racket in app.rkt
↓ raco make
Compile compiled/*.zo bytecode
↓ raco test
Test test submodule
↓ raco exe
Ship executable + distribute

racket with a file argument does not open a REPL. Add -i to run the file and then stay in the REPL.

RUN RACKET

racket
Start the REPL

racket *<file.rkt>* **[***<args>***...]**
Run a module with arguments

racket -e '*<expr>***'**
Evaluate an expression and print it

racket -i *<file.rkt>*
Run a file, then enter the REPL

THE REPL

(exit) / Ctrl+D
Leave the REPL

,enter *<file.rkt>*
Enter a module's namespace

,require *<module>*
Require a module

RACO MAKE AND EXE

raco make *<file.rkt>*
Compile a module and its dependencies

raco exe -o *<out>* *<file.rkt>*
Build a stand-alone executable

raco distribute *<dir>* *<exe>*
Package an exe with its runtime files

TESTS

raco test *<file.rkt>*
Run a module's test submodules

TESTS (cont.)

raco test *<dir>*
Test all modules in a directory

(module+ test ...)
Add tests inside the module

(require rackunit)
Load the unit-test library

(check-equal? *<actual>* *<expected>***)**
Check two values are equal

PACKAGES

raco pkg install *<pkg>*
Install a package from the catalog

raco pkg install --auto *<pkg>*
Install and fetch missing dependencies

raco pkg update *<pkg>*
Update a package

raco pkg remove *<pkg>*
Uninstall a package

raco pkg show
List installed packages

raco pkg install --link *<dir>*
Link a local directory as a package

TOOLS AND DOCS

raco docs *<term>*
Search the documentation

raco fmt *<file.rkt>*
Print the formatted program

raco fmt -i *<file.rkt>*
Format in place

LANGUAGE BASICS

#lang racket
Full language with common libraries

#lang racket/base
Small, fast-loading language

(require *<module>***)**
Import a library or file

(provide *<id>* **...)**
Export bindings from a module

(define (*<f>* *<x>***) ...)**
Define a function

(module+ main ...)
Code run by racket <file>
